Example to plot directly into latex

19-10-2019

1 Introduction

2 Genetic Algorithm Performance

To illustrate how the python code exports the figures directly into the report, this second "hw2" is included. Below are the pictures that are created by the code listed in **??** and **??**.

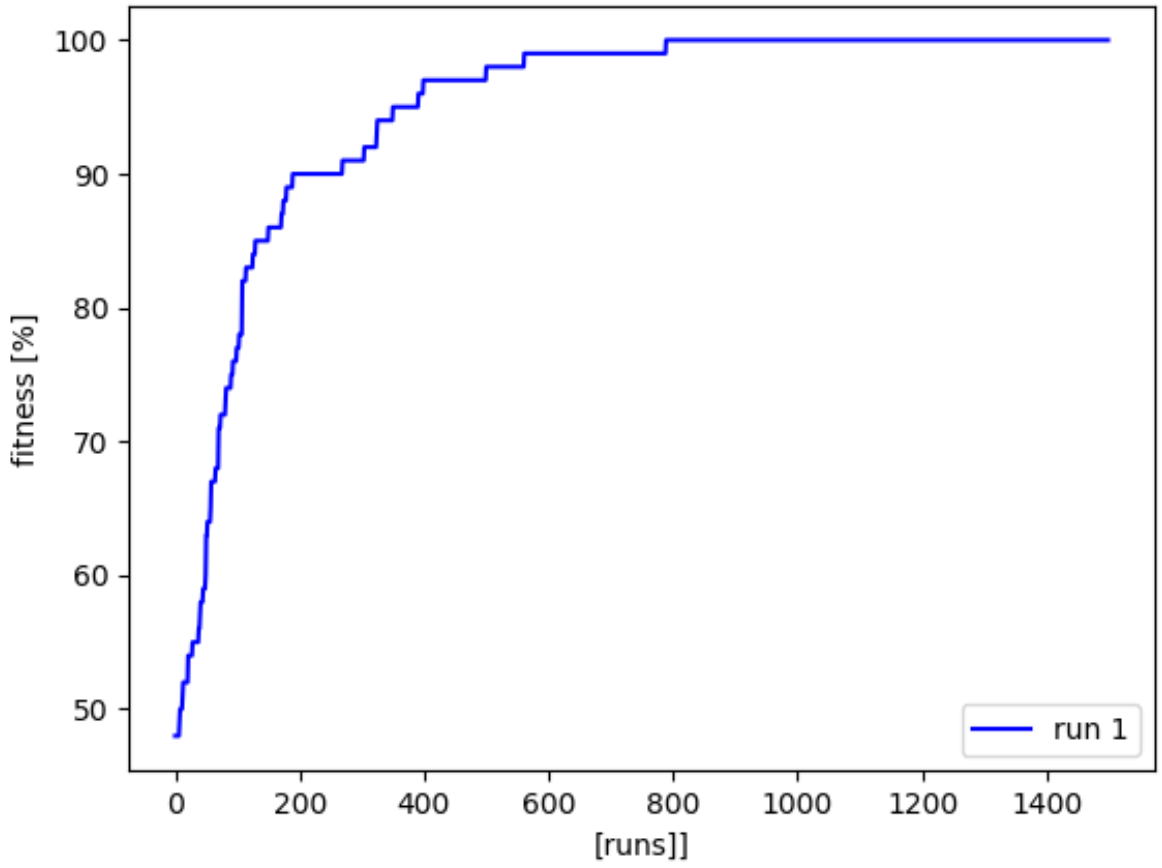

Figure 1: Performance of some genetic algorithm

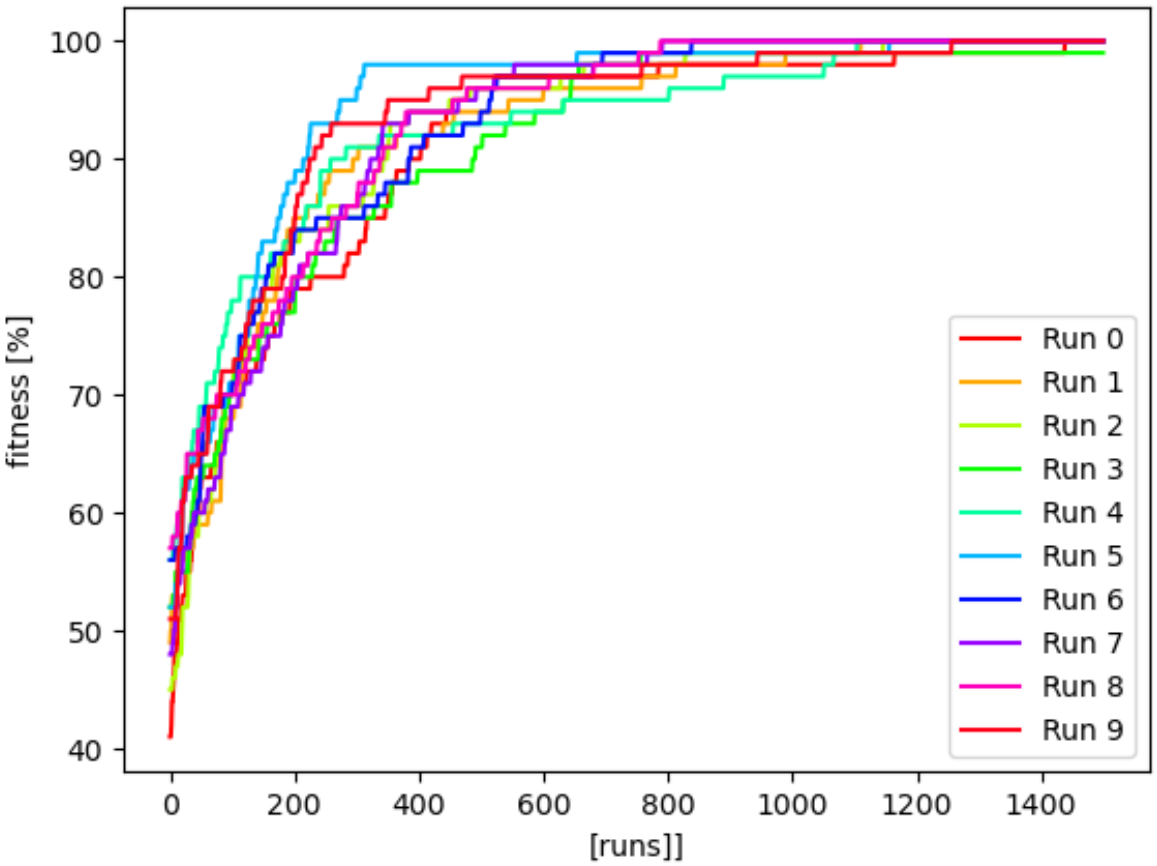

Figure 2: Performance of some genetic algorithm

A Appendix __main__.py

```
import os
from .Main import Main
from .Compile_latex import Compile_latex

print(f'Hi, I\'ll be running the main code, and I\'ll let you know when I\'m done.')
project_nr = 1
main = Main()

# compile the latex report
compile_latex =Compile_latex(project_nr ,'main.tex')
exit()

# run the jupyter notebooks for assignment 1
main.run_jupyter_notebooks()

# convert jupyter notebook for assignment 1 to pdf
main.convert_notebook_to_pdf()

# compile the latex report
compile_latex =Compile_latex(project_nr ,'main.tex')

##################################################################
############example code to illustrate latex  image sync ###############
##################################################################
# run a genetic algorithm to create some data for a plot.
print("now running a")
res = main.do_run_a()

# plot some graph with a single line, general form is:
# plt_tex.plotSingleLines(plt_tex,x,y,"x-axis label","y-axis label", lineLabels,"filename",legend_position,project_nr)
# main.plt_tex.plotSingleLine(plt_tex,range(0, len(res)),res,"[runs ]]","fitness [%]","run 1","4a",4,project_nr)

# run a genetic algorithm to create some data for another plot.
print("now running b")
main.do4b(project_nr)

# run a genetic algorithm to create some data for another plot.
print("now running 4c")
main.do4c(project_nr)

print(f'Done.')
```

Appendix python code that exports figures to latex

```
### Call this from another file, for project 11, question 3b:
### from Plot_to_tex import Plot_to_tex as plt_tex
### multiple_y_series = np.zeros((nrOfDataSeries,nrOfDataPoints), dtype=int); # actually fill with data
### lineLabels = [] # add a label for each dataseries
### plt_tex.plotMultipleLines(plt_tex,single_x_series, multiple_y_series,"x-axis label [units]","y-axis label [units]",lineLabels,"3b",4,11)
### 4b=filename
### 4 = position of legend, e.g. top right.
###
### For a single line, use:
### plt_tex.plotSingleLine(plt_tex,range(0, len(dataseries)), dataseries,"x-axis label [units]","y-axis label [units]", lineLabel,"3b",4,11)

### You can also plot a table directly into latex, see example_create_a_table(..)
###
### Then put it in latex with for example:
###\begin{table}[H]
###    \centering
###    \caption{Results some computation.}\label{tab:some_computation}
###    \begin{tabular}{|c|c|} % remember to update this to show all columns of table
###        \hline
###        \input{latex/project3/tables/q2.txt}
###    \end{tabular}
###\end{table}
